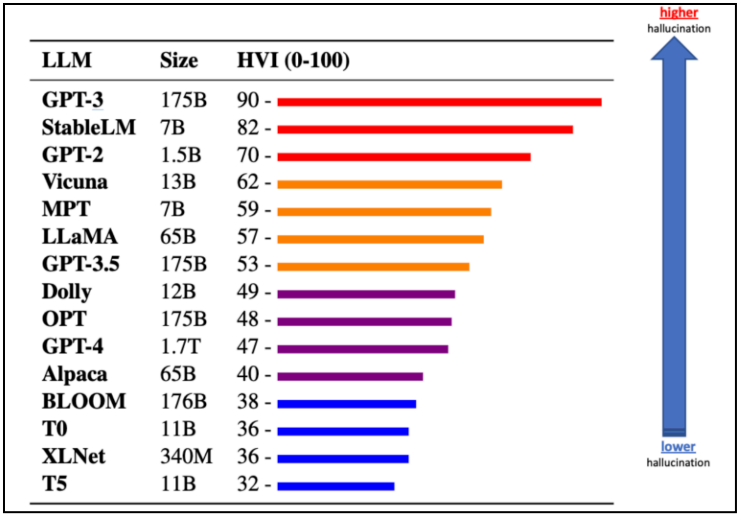
Question: Which large language model achieves a lower HVI score than OPT but a higher HVI score than Alpaca?
Image Type: Figure
Reasoning Type: Comparison
Target Paper: GPT-4



LLM	Size	HVI (0-100)
GPT-3	175B	90
StableLM	7B	82
GPT-2	1.5B	70
Vicuna	13B	62
MPT	7B	59
LLaMA	65B	57
GPT-3.5	175B	53
Dolly	12B	49
OPT	175B	48
GPT-4	1.7T	47
Alpaca	65B	40
BLOOM	176B	38
T0	11B	36
XLNet	340M	36
T5	11B	32

GPT-4V(ision) Response: Based on the provided figure, the large language model (LLM) that achieves a lower Hallucination Versatility Index (HVI) score than OPT but a higher HVI score than Alpaca is GPT-4. The HVI score for GPT-4 is 47, which is lower than OPT's score of 48 and higher than Alpaca's score of 40.

Now, let's re-rank the list of paper candidates based on their relevance to the question about the HVI scores of large language models.

Relevant papers will likely discuss the hallucination issue in large language models, methods to mitigate hallucinations, comparisons of different models' propensity to hallucinate, or the development and characteristics of specific models mentioned in the question (GPT-4, OPT, Alpaca).

Target Paper Ranking: 1
