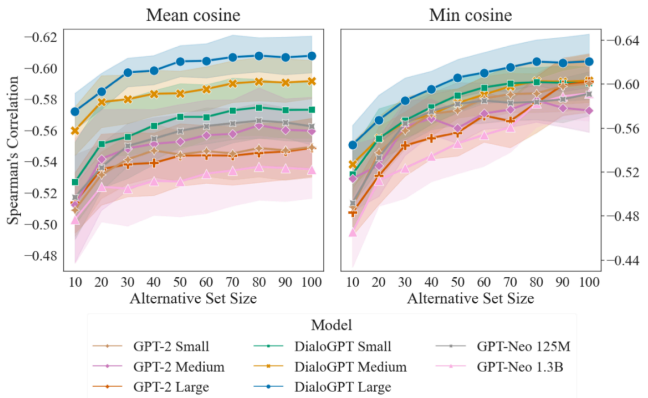
① Reading an anchor paper

② Identifying a reference paper from the anchor paper's bibliography

③ Reading the reference paper

***Information Value* Paper**

"The results presented in the *Information Value* paper are intriguing. The figure clearly indicates that the DialoGPT family of models exhibits the most negative Spearman's Correlation Coefficient compared to all other models."



DialoGPT

anchor paper's bibliography

***DialoGPT* Paper**

"I don't recall some of the specifics from the DialoGPT paper. Could you remind me which dataset the base model of DialoGPT was trained on?"

**3.1 Model Architecture**
We trained our DIALOGPT model **on the basis of the GPT-2** (Radford et al., 2018) architecture. The GPT-2 transformer model adopts the generic transformer language model (Vaswani et al., 2017) and leverages a stack of masked multi-head selfattention layers to **train on massive web-text data**. The text generated either from scratch or based on a user-specific prompt is realistic-looking. The success of GPT-2 demonstrates that a transformer language model is able to characterize human language data distributions at a fine-grained level, presumably due to large large model capacity and superior efficiency.

***Benchmark Construction Example***

**Visual Context Question:**
"Which model exhibits the most negative Spearman's Correlation Coefficient?"

**Visual Context Answer:** DialoGPT Large

**Visual Context Reasoning:**
DialoGPT Large exhibits the most negative Spearman's Correlation Coefficient.

**Visual Context Reasoning Type:** Direct Comparison

**Combined Question:**
Consider the paper that introduces the model that exhibits the most negative Spearman's Correlation Coefficient. What dataset is the base model trained on?

**Reference-based Question:**
"What dataset is the base model of DialoGPT trained on?"

**Reference-based Answer:** Massive web-text data.

**Reference-based Reasoning:**
GPT-2 is the base model used in DialoGPT. GPT-2 is trained on massive web-text data.

**Reference-based Reasoning Type:** Methodological Analysis
