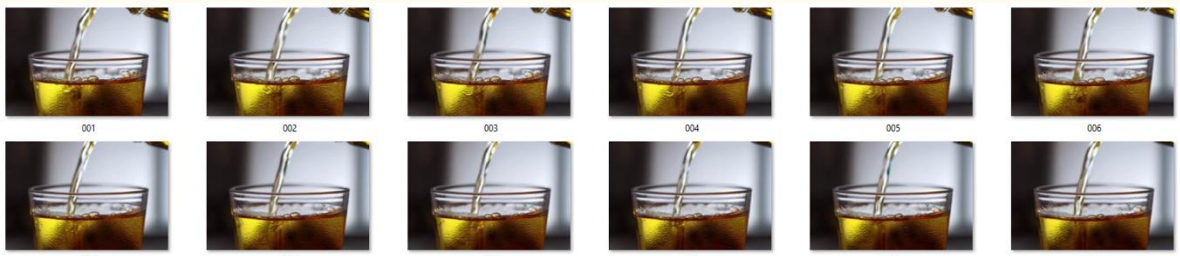
Physical Plausibility Reasoning

Case 1 (Failure)



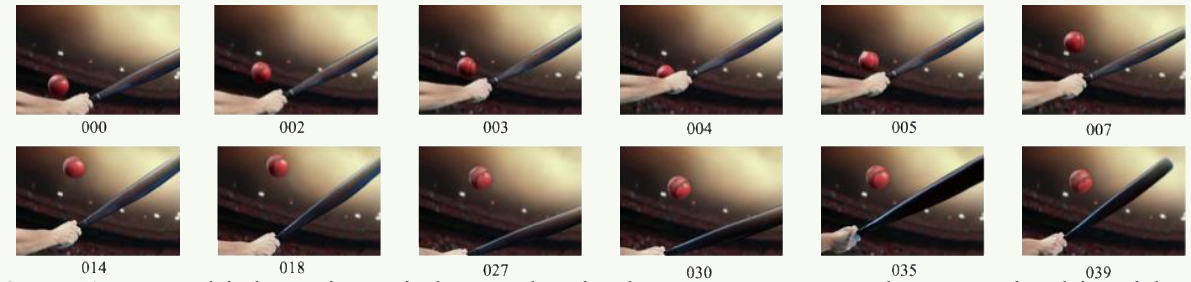
Question: Which option violates physical common sense the most in this video?

A. The glass level goes down while pouring.
B. The liquid teleports from the stream directly to the tabletop without passing through the glass.
C. The stream passes through the intact sidewall of the glass without wetting it.
D. The liquid congeals midair into a solid rod that then slides into the glass.

GPT-5 answer: B ✗
GT answer: A

GPT-5 self-explanation: *Matter doesn't disappear from one place and reappear somewhere else; fluids must follow a continuous path under gravity. Teleportation breaks locality and conservation of mass, making it the most extreme violation.- A could occur with a leak or siphon removing liquid faster than it's added.- C would require the stream to pass through solid glass (impossible without a hole).- D would require a rapid phase change to a solid, which is fantastical but still less fundamental than outright teleportation.*

Case 2 (Success)



Question: Which option violates physical common sense the most in this video?

A. The bat passes cleanly through the ball without any change in speed, spin, or trajectory.
B. The ball kind of hangs and moves as if gravity isn't doing much, while the bat looks a bit soft and deforming.
C. The ball abruptly flips its spin direction in midair with no contact or torque.
D. The ball splits into two midair and merges back together without contact.

GPT-5 answer: B ✓
GT answer: B

GPT-5 self-explanation: *The video shows the ball floating unnaturally, as if gravity is weak, and both ball and bat squashing like soft rubber. That contradicts expected gravity and rigid-body behavior. The other options (passing through without interaction, spontaneous spin flip, or splitting/merging) don't occur here.*
